

Instruments for professionals

For over two decades Batten-Edwards have specialised in providing quality high grade instruments. All Batten-Edwards instruments are made to the very highest engineering standards to withstand the rigours of constant autoclaving, including CSSD procedures.

**GUARANTEE** All instruments are guaranteed against manufacturing defects. Damage caused by incorrect cleaning, sterilisation, poor maintenance and damage to pointed instruments is not covered by our guarantee.

## The following important tips can extend the life of your instruments

### Cleaning

Ultrasound cleaning is the recommended method for use in podiatry.

- Avoid using tap water in any form of cleaning, water contains high concentration of minerals which can cause stain
- Always clean instruments in the open position and fully submerge in the cleaning solution
- Rinse the instruments after cleaning and dry thoroughly with towel
- Holding used instruments in a dry container without rinsing may allow organic materials, blood and debris to dry onto instruments surface. It will not only make cleaning more difficult but it can also leave some tough stains on the surface

### Autoclaving/Sterilisation

Steam sterilisation in an autoclave is the only recommended method for use in podiatry

- Lubricate the instruments joints prior to autoclaving
- Do not mix different metals, you may autoclave instruments individually or in sets
- Non stainless steel instruments are not suitable for autoclaving.
- Use distilled water, tap water will cause staining
- Care must be taken when autoclaving all pointed instruments to avoid damaging the head, place either upright or in horizontal position

### Staining or Rusting

Stainless Steel instruments, if handled with care, rarely rust. Dark areas on the surface are most often mistaken for rust. In fact these marks are surface deposits. After autoclaving, you may notice a stain on your instruments. Stains appear in many colours and, in most cases the colours tell you about the origin of the stain.

### Orange-Brown Stain

The problem is most often a phosphate layer on the instrument which is usually caused by: water sources, detergents used to wash and clean instruments, surgical wrappings, cold sterilisation solutions, or dried blood.

### Black Stain

The most common black stains are due to acid reaction. Black stains may result from detergents used to clean the instruments; similar to brown stains caused by high pH detergents. The black acid type stain can be caused by low pH (less than 6) during autoclaving.

### Bluish-Black Stain

These are usually a result of plating and caused by mixing dissimilar metals in ultrasonic cleaners and during autoclaving. Multi-colour stains are most often due to excessive heat (chromium oxide stains), and actually show rainbow colours with a blue or brown overtone. When the instrument shows these heat stains, it may have lost part of its original hardness.

### Discolouration of Instruments

The most common discolouration is due to deposit stains and usually occurs during autoclaving. To minimise staining, it is important the autoclave runs perfectly, and that it has a well functioning drying cycle. The instruments should come out completely dry, whether in wrappers or loose on a tray. If any moisture is left in the pack, or on the instruments, it will result in tiny water droplets on the instruments surface, which will leave a circular stain after drying. The colour of this stain will depend on the pH, as well as the mineral or metal contents of the water. If the drying cycle works perfectly, however, there is much less chance for the deposits to form on the surface of the instruments.

### Be careful with the cleansers

The cleansers and cleaning agents used could also be a cause of staining, pitting, marking and even corrosion. Strong substances, as well as those containing a chemical make-up of acid or alkaline-based solutions can lead to pitting and staining. Dish soap or surgeons hand scrub should not be used; these products cause spotting and corrosion. Using an instrument cleaning brush is a good idea, especially for jaw serrations, teeth and hinged areas.

### What is pitting?

Pitting can occur when an instrument is autoclaved using a solution containing chloride or an acid based detergent. Hydrochloric acid, formed in the solution, removes the protective chromium oxide layer of the stainless steel. The acid can then attack the unprotected steel and cause pitting.

Avoid the problem of pitting by using only pH neutral (7.0) detergents and making sure all instruments are thoroughly rinsed before placing in the autoclave. Avoid instruments touching during the autoclave process to eliminate pitting.

### Instruments Etching

An etching service for multiple quantities of your instruments ranges can be provided for all Batten-Edwards instruments. This is mainly used by NHS Trusts for dating and tracking instruments. This etching cannot be removed under normal autoclaving conditions. The service is provided Free of Charge for large quantity orders and must be requested at time of purchase.

## Cantilever Nippers

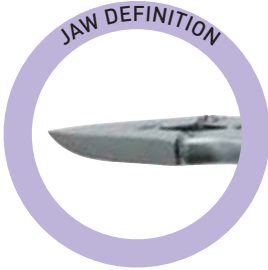

Quantity Discounts Available for all  
Podiatry Instruments

Instruments for professionals

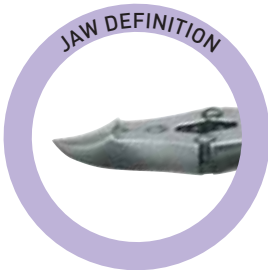

### Cantilever Straight Nipper

- 15cm, cantilever nipper with double spring action
- Straight jaw, smooth handles & safety lock

1109 Cantilever Straight Nipper 15cm £26.95

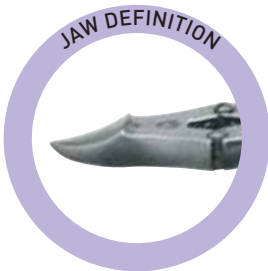

### Cantilever Concave Small Jaw Nipper

- 15cm, cantilever nipper with double spring action
- Concave small jaw, smooth handles & safety lock

1108 Cantilever Concave Small Jaw Nipper 15cm £26.95

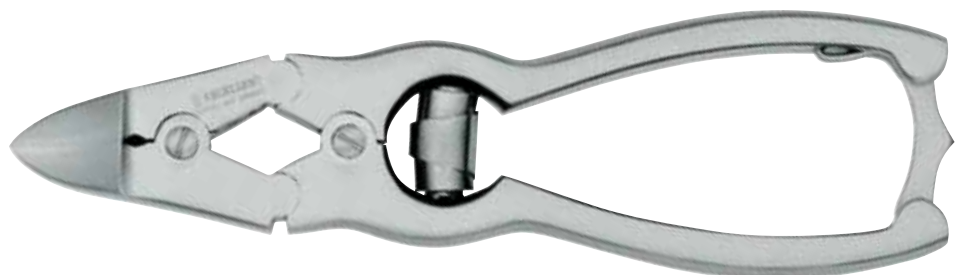

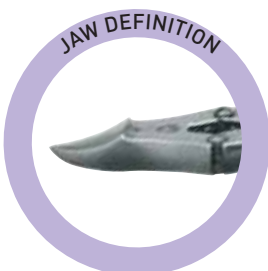

### Cantilever Concave Large Jaw Nipper

- 15cm, cantilever nipper with double spring action
- Concave large jaw, smooth handles & safety lock

1107 Cantilever Concave Large Jaw Nipper 15cm £26.95

### Cantilever Concave Large Jaw Nipper

- 15cm, cantilever nipper with double spring action
- Concave large jaw, smooth handles & safety lock

1113 Cantilever Concave Large Jaw Nipper 15cm £22.95
